

## Winter Operations Facts and Figures -2022-2023 Winter Season

The Maryland Department of Transportation State Highway Administration (MDOT SHA) owns and maintains all non-toll, numbered roads in Maryland's 23 counties. The Maryland Transportation Authority (MDTA) maintains Maryland's toll facilities.

### Total State Quantities of Materials Available at the Start of 2022-2023 Winter Season

- **Rock salt in 93 salt facilities** 390,000 tons
- **Salt brine at 77 sites** 1.7 million gallons
- **Abrasives (statewide) – sand and crushed stone** 40,000 tons
- **Magnesium chloride at 16 sites** 100,000 gallons

**Budget for winter 2022/2023:** \$76 million

**Lane Miles Maintained (MDOT SHA and MDTA):** 18,177 miles  
(Length of roadway times the number of lanes, including ramps)

**Pieces of Equipment (State and contractor): Available to Fight Winter Storms:** Up To 2,700

**Number of People (State and contractor): Available to Fight Winter Storms:** Up To 2,700

### Winter Operations Expenditures and Salt Usage (five-year period)

<u>Fiscal Year</u>	<u>Expenditures</u>	<u>Salt Used</u>
FY 2018	\$86,686,146	184,877 tons
FY 2019	\$95,498,676	210,193 tons
FY 2020	\$36,352,376	36,611 tons
FY 2021	\$104,395,711	241,066 tons
FY 2022	\$76,975,608	154,650 tons

### Materials Available for 2022-2023 Winter Season

- **Rock Salt** is the principal winter material used by state and contractor forces. It is 100 percent effective at pavement temperatures of 20° F and above but starts to lose its melting properties once below this threshold.
- **Salt brine** is a solution that can be used as an anti-icing agent on highways prior to the onset of a storm or as a deicer on highways during a storm. Salt brine is 23.3 percent salt and 76.7 percent water. MDOT SHA makes extensive use of this material. It has a freeze point of -6° F and costs approximately 15 cents per gallon to produce and transport. Salt brine will be produced and used at MDOT SHA's 15 brine-making facilities.
- **Magnesium Chloride** is a liquid winter material used in de-icing operations. The material has a freeze point of approximately -26° F. It is used in the colder regions of the state, primarily in the northern and western counties. In Maryland, magnesium chloride typically is used in conjunction with salt brine.

## Strategies for Winter Operations

- **Anti-Icing (pre-treatment)** – In the days before a storm, MDOT SHA applies salt brine to the pavement, which prevents snow from initially bonding to the pavement. MDOT SHA is expanding its anti-icing operations to lessen salt usage throughout Maryland. Salt brine, which is 23.3 percent salt and 76.7 percent water, is produced at 15 MDOT SHA maintenance facilities. MDOT SHA **will not** pre-treat highways with salt brine if a storm is forecasted to start as rain as, this will wash the salt brine solution off the pavement. Additionally, MDOT SHA will not apply salt brine in temperatures 20 degrees or colder because the application may freeze on contact.
- **Deicing** – This is the traditional winter maintenance strategy of salting. Rock salt requires more material to break the bond than to prevent it. Salt is the primary material used to treat pavement in snow or ice operations. In colder areas or for a thicker snowpack on the road, crews can add magnesium chloride or “Liquid Mag” to rock salt or salt brine during extremely cold temperatures to enhance salt’s effectiveness.
- **Liquid Salt Brine-Only or Direct Liquid Application (DLA) Snow Routes** – This consists of a designated snow route that only uses a salt brine solution to prevent the snow and ice from bonding to the pavement. Unlike anti-icing, which only takes place **prior** to the event, this strategy is performed for the **duration of the event**. MDOT SHA now has about 400 lane miles of liquid salt brine-only routes throughout its seven engineering districts. When compared to snow routes using granular rock salt as the main snow-fighting compound, the liquid salt brine-only routes not only perform at or above the expected level of service but use far less salt.
- **Loader Scales** - MDOT SHA has purchased a total of 26 loader scales that are mounted on MDOT SHA loaders at salt facilities. The scales accurately capture the precise amount of salt being loaded for distribution onto Maryland roadways. This allows MDOT SHA to accurately control the storage, handling, application, and recovery of dispensed granular salt and reduce overall salt usage.
- **Rubber Plow Blade with Ceramic Inserts** - The rubber/ceramic blades are superior to steel blades from both a performance and efficiency perspective. These newer plow blades move more snow from the roadway, which results in less salt to treat the road during plowing operations. To meet the demands of our operators, MDOT SHA placed a bulk order for the hybrid blades this winter season to ensure enough resources are on hand for each facility.
- **Winter Operations Training** – Twenty percent of maintenance personnel are required to attend Snow College each year. MDOT SHA’s goal is to train 100 percent of our employees at least once every five years. This winter will focus on the negative and lasting impacts that salt has on our infrastructure. Past data obtained with winter training was so beneficial it led to the creation of a best practices document that was distributed statewide. This statewide initiative will be a staple in our salt-reduction tactics for years to come.

## Technology Available for 2022-2023 Winter Season

In addition to its fleet of salt spreading/snow plowing dump trucks, state and contractor crews will deploy:

- **600 truck-mounted saddle tanks:** This equipment is used to pre-wet salt with salt brine or liquid magnesium as the salt is spread on highways. Pre-wetting salt helps it adhere to the pavement (reducing waste), dilute into a brine solution quicker (making salt more effective) and work at lower temperatures. Nearly all MDOT SHA’s fleet of single-axle dump trucks are equipped with this technology.
- **310 wing plows:** A wing plow is an additional plow mounted on the right side of a plow truck or grader. The extra plow allows crews to clear more snow from the road and shoulder in one pass, increasing efficiency while reducing the need for extra trucks and our carbon footprint.
- **23 truck/trailer-mounted liquid applicator spray tanks:** These units are used for anti-icing operations and liquid-only routes (spraying salt brine on roads and bridges prior to precipitation to prevent snow and ice from bonding to the pavement).

- **15 salt brine makers:** These 15 salt brine makers are strategically placed around the state to fill and replenish up to 77 different locations throughout Maryland. This year, MDOT SHA is replacing its brine makers with automated units that can produce up to 9,000 gallons of brine per hour. This will help ease the burden of brine tank replenishment by quadrupling the output of our current units while producing a perfectly blended solution.
- **2 tow plows:** A tow plow is a separate plow that is towed behind an MDOT SHA salt/plow truck and will clear an extra highway travel lane. Tow plows will be used in conjunction with snowplow trains (several trucks driving in tandem). The introduction of the tow plow into MDOT SHA's fleet will help enhance highway snow-clearing operations with fewer passes and fewer trucks on the highway.
- **4 Dual-Wing plows:** MDOT SHA is employing four dual-wing plows in Allegany, Frederick, Garrett, and Montgomery counties. The extra wing plow can clear a two-lane highway in one pass.
- **23 Quad-Axle trucks:** MDOT SHA is employing trucks with enhanced material carrying capacity to treat longer sections of road. The enhanced capacity will allow the plow trucks to apply anti-icing material to more lane miles for better clearing results.
- **78 Non-Invasive Road Sensors:** Non-invasive sensors mounted to overhead signs or poles and can detect the thickness of water, snow, or ice within 1 mm of accuracy. It also measures surface temperature, road conditions, and freeze point/salt concentration on the road surface. This type of unit eliminates the need to install a sensor in the pavement.
- **102 Mobile Advanced Road Weather Information Sensor (MARWIS)** - MDOT SHA has installed 153 MARWIS sensors on maintenance equipment used in snow operations. The mobile road weather sensors will transform vehicles into mobile weather stations by detecting several critical road weather parameters, including temperatures, precipitation amounts and types (rain, snow, sleet, etc.), relative humidity, dew points, and traction. Together with other sensors on MDOT SHA weather stations, the technology will enable MDOT SHA maintenance forces to have real-time information and help in the tactical deployment of equipment.
